Week 8

Point out the ethical issues that LLMs or generative AI could pose and discuss possible solutions. You may utilize commercial services for large-scale language modeling, such like ChatGPT if available, but if you do, specify which part of your answer is the result of the utilization of such services. In total, your response should be approximately 400 words.

Grading policy: Originality (I would also asks ChatGPT the same question) and impact either in technological point of view or social point of view.

Answer given in manaba text box

Assignment submitted by Trevanna Andrea（Submitted on：2023-12-13 15:39)

At first, I use perplexity AI, sources (perplexity AI gives link to online sources), and other online sources first to get ideas of what ethical issues may arise. However, I also have original ideas. I mark the ethical issues I consider from using AI and online sources with an asterisk (*).

Ethical issues:

*1. Copyright issues

Some generative AI (GAI) like ChatGPT and Bard Chrome give data and answers without giving sources, so this can lead to copyright infringement. Also, when the generative AI applications was still in the machine learning and training stage, it might be given lots of data across the web (i.e through web scraping) without permission by the original creators of the web content, art etc., so the efforts of people who created the data may not be properly acknowledged.

2. GAI can create its own art and perform calculations much more quickly than even workers and scientists. Thus, generative AI can replace jobs.

3. The usage of GAI can induce students tempted to cheat on assignments and online exams. As generative AI applications such as ChatGPT can answer many types of questions, summarize an article, and is only a click away, students became too lazy to think and study, and cheat.

*4. Privacy issues

During its machine learning and training period, generative AI may access and retain personal information and data that its users may not willingly and voluntarily disclose. This can be dangerous as the data may be maliciously used by attackers.

How to solve this:

1. Push generative AI like ChatGPT and Bard to also include sources if they generate answers to questions, so that it is clear which data source they acquire from during their machine learning phase and so forth.

2. As generative AI may possibly replace jobs in the future, motivate people and children to expand creativity- one that AI seems to lack so far is to connect new ideas and create something unprecedented-, and study programming and AI so that we can control AI and create new jobs for

humans in the future to prevent unemployment.

3. Regulate the use of AI of students in their assignment and ban the use of generative AI in exams- through asking the same question in ChatGPT and compare students' answers.

4. Include the terms and conditions and privacy permissions clearly.

5. Users must be alerted that generative AI could give misleading data as the AI may be fed mistaken and misleading data during its training. Users should just use AI as the first idea and not for professional advice.

In the machine learning phase, programmers are responsible to give the correct data. Whenever possible, use supervised machine learning.

6. Alert website owners or owners of intellectual property/art etc. for permission before the web sites is being scraped for data purposes in machine learning.
